

1.4.8 Adjustment model

Select all models of globe components except Earth, press the Shift key, press the right mouse button and select "Combine" to merge all models except Earth into one object. At this time, the whole globe is two objects, one is the earth, the other is all the models outside the earth.

Select all objects and move upward so that the base is just above the origin of the coordinates. You can click the space bar to see if the model is in the right position through different view windows.

The following three steps are performed on the globe model: A. Free transformation. B. Delete history. C. Center Pivot.

Two steps are performed on the merged objects of the remaining parts of the globe: A. Free transformation. B. Delete history. Note that the coordinate axis of this object is specially specified and do not Center Pivot them.
