

1.2.5 The Recognition Image For Printing And The Recognition Image For Program

In the ARColor, the wireframe of the Color-painting part should not be used as the recognition information in the recognition Image.

If the wireframe is used as recognition information, once it is covered in the painting process, the recognition information will change or decrease, affecting the location of AR. The picture books that are finally given to users are wireframes.

That is to say, when the recognition Image is finished, two pictures will be obtained.

This one without wireframe is used as identification information in the program, and the printed wireframe is used as solid paper for users to color. In this way, the recognition information will not be affected whether the wireframe is covered by the color or not.
